PHPMadmin

Hits: 3,676

Description: PHPMAdmin uses PHP and MySQL to build DHTML menus on the fly! Features include: Scalable - user may add new 'properties' to their PHPMadmin system without waiting for a patch or a new version of PHPMadmin.

Portability – Site admins can easily insert a menu from PHPMadmin into ANY page within their site using one small line of PHP code.

Speed – PHPMadmin uses data caching so that your pages don't have to process all the menu data on each load. PHPMadmin will only load the menus from the database when you have made a change to the database.

Search-Engine friendly – PHPMadmin has a built-in function that can insert ALL links contained in the database into hidden fields within each web page.

With PHPMadmin, you can develop your menus and styles and when ready - you can simply hit 'Download Menu Files' from the main PHPMadmin menu.

'Developer mode' - When developing menus and menu styles, you may save as many as you want in PHPMadmin, switching between them as needed.

Resource Specifications

Version:	1.0
