**Description:** Patched possible xss issues, and added some languages.

Now with language packs!

This wiki is great for documenting, describing or showing things. There is a fast built in rich text editor (wysiwyg) that allows you to create and edit pages like you would in a word processor (bold, italic, underline buttons etc.)

There is also the option to turn off public account creation and allow only certain people to edit/create pages. Searching is fast and includes the last modified timestamp as well as who made the change. Now includes custom RSS feeds, a complete revision / reverting system, and themes.

The install is fast and easy, and the wiki looks great!
