## (E)SMTP Mailer for PHP

Hits: 5,246

**Description:** Here is something you always wanted.

If you are a php developer and used Windows, you would have with held your application form sending e-mails because of mail() function not working on Windows without a SMTP server. Worry no further. The solution is available now under GNU Public License. (E)SMTP Mailer for PHP is a PHP class which you can intergrate with your application to send mail as long as the server the script is running is connected to the internet.

How (E)SMTP Mailer for PHP works

(E)SMTP Mailer for PHP only relies on DNS records and the destination ESMTP/SMTP server. It acts as a Mail Transfer agent and negotiates the destination mail server to send the mail. Note

(E)SMTP Mailer for PHP requires PHP5 or above to run.

SMTP Mailer for PHP works o linux and windows without a problem. Get's plain text mails safely into inbox but HTML mails are sometimes regarded as spam.

Reporting could improve, not just success or failure, but to which addresses it was sent and to which failed
