Orbit42 Base Class 1.3 - STABLE

Hits: 1,189

Description: The base class of Orbit42.com (now considered stable) is an opensource (free) project released with the hope that others would benefit from a class that contains the basics already. The Object Oriented project is hosted by sourceforge.net.

Such basics include iterative functions (allowing each parent in the chain to contribute without the need for complex namespace), debugging and error messaging system (from 1.1) and a callback manager (allows easy plugin structure).

The aim is to create a system that makes good use of the best design patterns an easier thing to create.

It also supports simple abstraction to datalayer (this is MySQL by default). There is now a second version in development.

Resource Specifications

Version:	1.30
Platform(s):	linux, windows, freebsd, osx, sun
Date Added:	Nov 8th, 2006
Last Updated:	Jan 21st, 2007
Author:	Lord Matt
