As a beginner at php I'd just spent a week learning as much as I could absorb about php when I came across this tutorial. Could incorporating cms really be this easy? My answer: yes! The tutorial keeps the process simple and the instructions are clear and well explained. In the process of setting it up I went to [snipertools.com](http://snipertools.com) to learn about .htaccess files; I also looked at [imanager](#) for uploading images. An excellent and straight-forward tutorial, but some knowledge of php a definite advantage.
