# Zaintech Link Cloaker

Hits: 559

**Description:** How does it work? This is really a very simple but highly effective concept. This script takes your actual link (URL that you want potential visitors to click on) and maps it to another link. Each URL that you add is assigned a unique ID. The mapped link is nothing but a link with this unique ID. When you use this mapped link in place of your actual link, and when someone clicks on the mapped link, this script records the parameters associated with the visitor and forwards the visitor to the actual link. All this happens in the background and your visitor doesn't even notice the difference. Visitors get to the link they want and you get the important tracking record for your visitors.

**Requirements:** You must have a website with hosting service that supports ASP (Active Server Pages). MS Access Database

## Resource Specifications

<b>Version:</b>	1.0
<b>Platform(s):</b>	windows
<b>Date Added:</b>	Feb 2nd, 2007
<b>Author:</b>	Zaintech Technologies

**Average Visitor Rating:**  **4.50** (out of 5)

Number of Ratings: 2 Votes

**Average Member Rating:**  **0.00** (out of 5)

Number of Reviews: 0 Reviews
