A-1 PHP Form Wizard for Dummies

Hits: 4,246

Description: This script works like a wizard that takes you through the various stages involved in creating a PHP form, without having to know the PHP language. You just need to answer the various questions and the wizard will create the code for you.

You can add a Javascript validation to the form.

Finally, you can customise your PHP form with your favourite HTML editor, so that it suits your web site's colour scheme and style.

Summary of features

=====

- First page checks the required server configuration
- Most fields now have detailed context-sensitive help with screen shots
- The form now allows you to redirect the user to a thank you page
- The final page allows you to copy the entire PHP form but also allows you to select separately the PHP , Javascript and HTML part, for easier integration to an existing page.

Resource Specifications

Version:	1.2
