# TUTOS

Hits: 94,445

**Description:** TUTOS, stands for The Ultimate Team Organisation Software, is a PHP based groupware or ERP/CRM/PLM tool to manage the organizational needs of small/medium groups, teams, departments. Some of its web-based tools include: a calendar for team and personal use, address manager with links to fax and SMS product repository, bug tracking system, email notification for appointments, inventory, bugs and notes, a task management for projects or personal needs, a document management system with versioning and a timetracking system. All the tools and objects are heavily linked together and allow a fast and easy information retrieval. TUTOS is multilingual and currently supports about 18 languages or dialects. Supports four different database systems: PostgreSQL, MySQL.

## Resource Specifications

### **Best collaboration tool**, Mar 8th, 2003

Reviewed By: rvergara

I recently joined a small software company (20 employees) as their CEO. I found that people were working in 7 or so different countries trying to collaborate with their peers across different timezones, languages, etc. based on just telephone calls, e-mails, written notes and they were not coping with the related difficulties.

Day 3 of my job I had Tutos installed and running and the rate of adoption and usage was extremely high and fast.

There are a lot of groupware around but if you are looking for a product that can support:

- Employees and customers in different geographies/timezones
- Need to relate incidents to projects and tasks with close tracking
- Need to automatically send changes on the incidents all across your teams (wherever they are) via e-mail
- Need to interact with your project stakeholders on-line in different languages
- Relate your meeting/memo notes and documents to the different tasks/incidents
- Get out of the box graphical statistics on how the tasks/incidents are progressing
- Audit who is doing what
- Focus on what is still outstanding to finalize the project and what is their current state

You absolutely, without any doubt, need TUTOS

### **Tutos has an excellent permission & group system., Sep 4th, 2002**

Reviewed By: marclaporte

Having looked at over a 100, I conclude that TUTOS is simply the most advanced GPL groupware/intranet/project manager available now.

#### CONS:

Not very good looking or flashy. However, you can use & design alternate themes to jazz it up.

The menu system could be more intuitive. However, it's possible to activate only a few modules for certain users or groups of users, making it simpler.

#### PROS:

-Absolutely superb permission & group system which gives you a precise control over who see & can edit what.

-Plenty of modules (calendar, bug tracking, file management, notes, tasks & projects, watchlist (notify of changes), resource, timetrack & invoice, fax, sms, addressbook, mail & LDAP, and others...

-Full documentation.

-Currently #2 on SF.net

-I disagree with previous post about "low flexibility": Tags can be easily modified in the language file.

#### WISHLIST:

-Wiki module

-URL bookmark manager

-Global search box

You should definitely install and play around with TUTOS. Another great choice is [phpgroupware.org](http://phpgroupware.org)

**For computer companies that work accross borders**, Jan 7th, 2002

Reviewed By: Sattwic

Tutos is a wonderful software that is great for small-medium groups with distributed location of individuals.

The description given above adequetly explains the software.

Some Cons that I came accross is: low flexibility for people who would like to customise it.

It has for examples, division of labour into 'installations', 'companies', 'costs', which might not apply to everybody who would like to use its core functions.

Installation is easy.. one drawback is that most of the files in the package end in \*.p3 and \*.pinc

... if your server doesn't recognise these extensions as PHP scripts, you will have to add a few lines to your apache configuration files.

If you are on virtual host, try to install it... backup and then delete the .htaccess in the php folder (the php folder is inside this package) if any accessing probems happen...

Interface is a bit tricky, it takes a couple of working to get used to it... could be simpler.

But none of the other groupware seem to have all the features that this has... so try this one out!

**Good idea, poor implementation, not for every company**, Feb 13th, 2006

Reviewed By: horbor

Abundance of unnecessary functions, uncomfortable interface with poor navigation, paradise for CEOs but a time-consuming, frustrating experience for your personnel. This is TUTOS for us.. If you want to control your employees better, to have everything in your hands, you can use it and profit from it. But don't forget to ask the people who work for you. Deadlines are good, time pressure is bad, especially in programming. Instead of thinking of better solutions, we think of the time booking.
