myORTHO

Hits: 1,966

Description: myORTHO is a free open source orthodontic software. It is basically written in PHP and runs through Apache and MYSQL. Using other open source software like Uniform Server and Aestan Tray software we have built myORTHO to run in Win32 environment. If you install this on any windows machine and extract the source code from Disk W, you can run it on any platform you customise to. Since this is an open source program, it will take time for us to develop and fix bugs.

Resource Specifications

Version:	1.0 Beta
