ICEMail

Hits: 9,028

Description: ICEMail is an email client written in Java that uses the JavaMail API to provide access to IMAP, POP and other mail services. ICEMail was written with Java 1.1 and the Java Foundation Classes. ICEMail is for anyone who uses IMAP or POP to access their email. ICEMail is especially ideal for users who are on the road alot, as remote access is simplified. ICEMail is also ideal for intranets, where many users are reading mail from an IMAP server, as installation can be centralized.
