dkLab Apache: run virtual hosts with privileges of different users and more

Hits: 737

Description: The dkLab Apache is a patched Apache distribution for those who plan to use the Apache Web server to serve multiple separate sites working under different, fully separated, and independent Unix users. It does not require you to install any OS kernel modules or disable setuid, and works correctly and intelligently with KeepAlive turned on and MaxRequestsPerChild greater than 1.

Resource Specifications	
Version:	2005-12-04
