ASP Website Youtube video downloader Hits: 1,370

Description: This is a Youtube video downloader written completely in ASP for Active Server Pages websites. It requires the component ASPhttp which is already installed on many ASP enabled hosts. If your host doesn't have it, they may install it for you. This script actually finds the real flash flv file urls and does not reference an externally hosted script. This is a simple, bare bones script that you can modify for your own needs. Please limit visitor downloads to only those files that you know are in the public domain, in order to respect copyrights.
