## Form Element Virtual Keyboard Interface Hits: 1,768

**Description:** Add accessibility to your text field, password field and textarea form elements with this handy javascript virtual keyboard. Simply include the javascript and CSS files in your pages, and apply a special class to the elements you want to be "keyboard enabled".

An icon will appear beside all enabled form elements which, when clicked, will make a virtual keyboard appear \*within\* the page - NOT a popup window. Users can then type characters into your forms using the mouse only.

Add your own keyboard layouts to make choosing the appropriate special characters a snap! Comes with 20+ keyboard layouts pre-configured. Users can switch between available keyboard layouts without reloading pages.

Useful for letting users type special characters on computers which have unfamiliar keyboard layouts, avoiding keyloggers by bypassing the physical keyboard, or to allow text input from computers where keyboard input is impossible or has been disabled.

### Resource Specifications

<b>Version:</b>	1.1
<b>Platform(s):</b>	linux, windows, freebsd, osx, sun
<b>Date Added:</b>	Jun 28th, 2007
<b>Last Updated:</b>	Apr 16th, 2008
<b>Author:</b>	GreyWyvern
