AJAX Validator

Hits: 5,724

Description: Webmasters can very simply and quickly implement this script into their website to improve user registration. AJAX allows users to know immediately if their desired username is valid, taken, or contains bad characters. The setup script is included with the file and just needs to be ran once to set up a database or hook it to an already created database. The registration script is very professional looking and can easily fit into any website. If you are interested in this script, please note that a MySQL database is required for AJAX to work properly. If you have one, then this is the script for you. Download it, try it out, implement it and see what you think. If you have any problems, we have open forums for you to post bugs or suggestions for the staff.

Excellent script, Oct 7th, 2007

Reviewed By: ramdhar

The script does what it promises to do in a simple and elegant manner. You must have knowledge of how to link to mysql databases, tables and the fields therein (which is easily learnt) and installation is very easy. Keep up the good work and may God bless!!
