# What's wrong with Perl and XML?

Hits: 3,146

**Description:** Although there are many excellent Perl modules dealing with many aspects of XML (among which a good dozen offer various ways of transforming XML documents), the languages that seem to be favored by XML developers are Java, C/C++, and maybe even Python. For example, questions on the XML-DEV list mostly involve Java, C++, and XSLT. Sun, IBM, and Microsoft all push Java or C++ implementations. Perl, the choice of many for programming on the Web, lags behind Java and C++ in the XML popularity contest. Michel Rodriguez shares his opinions on what's wrong, and what could be done about it.
