Mailview

Hits: 1,126

Description: Mailview is a PHP program to view email.

I searched for a simple and easy webmail application which was a) Fast b) Properly supported threads and c) didn't require a database. I could not find any so I wrote my own.

FEATURES:

- Simple, fast.
- Supports IMAP.
- Standard compliant: XHTML 1.1, CSS 2.1, RFC's 822, 1521, 1522, 2017, 2822, 2045-2049
- Runs out-of-the box, configuration is possible but optional.

REQUIRES php5 and the pcre, session, imap, and iconv extensions.

--

Mailview is NOT yet finished or widely tested yet, although it *should* be functional.

I created it mainly for personal purposes, but other people may find it useful also and/or extend it.

Any form of feedback would be much appreciated, email me at carpetsmoker@xs4all.nl
