Server Status Indication

Hits: 348

Description: Server Status Indication is a very small (1 page) PHP script that allows you to gather information for which services on a server, or servers are online/offline.

There are a bunch of included services such as cpanel, whm, directadmin, mysql, mssql, http, ftp & ssh.

The script is VERY easy to customize and make it look like your exsisting website.

This is a great tool for both web hosts and clients.
